SUMMARY

1. **Board members** have over 100 years of experience in financing, acquisitions, and mine making;
2. **Recent work** on the property has identified the historic Aguamas Mine. A trenching program and prospecting has outlined a strike length of 130m along the gold structure. The channelling returned 0.40 g/t Au over a width of 110m, including 13.03 g/t Au over 3m.
3. An 8 km long NE-bearing structure that has never been explored in the past but is host to several historic mines. At the Zamora Mine in the south, the author has discovered what is believed to be an extension of the Zamora vein to approximately 1 km in length and open in all directions; and about 7 km to the north the author has gained access to the northeast adit in the Campanillas Mine where all of the samples selected are showing evidence of intense alteration, brecciation, and mineralization. The quartz vein system on the main level at Campanillas is at its widest point, around 7-8m.
